The focus of this work has been to understand the mechanism of action of the isoxazole-based antimycobacterial 6-alkyl isoxazole-4-carboxylate derivatives and their combination with ethambutol in the treatment of MDR-TB. The activity of 11 compounds was investigated through reporter strain assays, to determine if they are synergistic with isoniazid and ethambutol. Several compounds were tested in whole cell assays to determine their effect on growth, and in radiolabeled macrophage infection assays to determine uptake. Several derivatives exhibited in vitro activity in doses well below those predicted by the lead compounds in vivo.
