A key feature of the Robot experience is the ability to easily create and modify models in the background. In this article, we will illustrate how you can easily transfer a model between your local Autodesk products using an Autodesk Data Transfer Toolbox that is bundled with Autodesk Robot. This is a continuation of the posts, How To: Translate part 1, 2 and 3. This article continues by demonstrating how you can perform the "transfer" process using either the Robot App's user interface or the Robot API's resource model. Through this Autodesk Community site, you can access the product support for Autodesk software. If you are part of the Autodesk Education Community, you can access this information by logging in and locating the product in question. Your Autodesk Support Contact information is displayed with each product. You can also locate your product's product key by clicking on the Get Serial button. Autodesk Robot Structural Analysis for Design and Revit is the most advanced version of Autodesk's Autodesk Civil 3D software to deliver structural analysis and design from the same model. Through powerful algorithms, Autodesk Robot replaces the need to import and model geometry several times during a structural design. Instead of creating geometry by hand, robot enables you to place geometry directly in your design model by modeling the object you create. Completing the experience is the ability to directly insert structural geometry and assembly information into your Revit models using the Autodesk import manager, API and the "insertion manager". Please visit our Support site: <http://support.autodesk.com/> to search for related articles, FAQs, and answers to common problems. This is also where Autodesk product updates and fixes are announced. For answers to frequently asked questions (FAQs), please visit the Autodesk Knowledge Base for robot.
